

# WINTERCREEPER, *Euonymus fortunei*,

## NON-NATIVE INVASIVE

It is an evergreen shrub which grows as a vine if provided with support. As such it grows to 66 ft, climbing by means of small rootlets on the stems, similar to ivy. Like ivy, it also has a sterile non-flowering juvenile climbing or creeping phase, which on reaching high enough into the crowns of trees to get more light, develops into an adult, flowering phase without climbing rootlets.
